

How the Picture Machine Works — bigLust in ComfyUI

Freedom System · the "recipe" that turns your words into a picture · read top to bottom

ComfyUI is a machine made of connected boxes. Each box does one small job, then passes its work to the next box. Here is the whole chain, in order. The only boxes you ever touch are the **green-marked** ones.

1 · Load Checkpoint

Opens the art model — the "brain" that knows how to paint. Ours is **bigLust**, which is trained for realistic, adult pictures. It hands out three things: the painter, the word-reader, and the developer (see boxes 2, 3, and 6).

You change this box only if you want a different model — like lustify or CyberRealistic Pony.

2 · Positive Prompt (the GREEN text box)

This is where you type what you **want** to see. Plain sentences work: "a red-haired woman by a window, soft light, sharp photo." The word-reader turns your sentence into something the painter understands.

You type your picture description here. This is the main box.

3 · Negative Prompt (the RED text box)

A list of things you do **not** want — blur, extra fingers, watermarks, cartoon look. It is already filled in with good defaults.

Leave this alone unless something keeps going wrong in your pictures.

4 · Empty Canvas (Empty Latent Image)

Sets the picture size and how many to make at once. Ours is **832 wide by 1216 tall** — a standing portrait shape.

Change the two numbers for a different shape: 1216×832 = wide, 1024×1024 = square.

5 · KSampler (the actual painting step)

Takes the painter (box 1), your "want" and "don't want" (boxes 2 and 3), and the blank canvas (box 4), and paints — starting from noise and cleaning it up over **26 passes**. The **seed** number is the random starting point; the same seed + same words = the same picture.

Usually leave the settings. Set seed control to "randomize" for a new picture each run, or "fixed" to keep tweaking the same one.

6 · VAE Decode (the developer)

Box 5's result is still in a coded form the computer uses. This box "develops" it into a normal picture you can actually see.

Never touch this. It just works.

7 · Save Image

Shows the finished picture and saves a copy to `app_cabinet/comfyui/output/freedom/`.

Nothing to do. Right-click the picture to save it somewhere else.

The three-minute version

To do this	Do this
Make a picture	Type a sentence in the green box, press Run , wait ~10–60 seconds.
Make a different picture, same idea	Just press Run again (seed is on "randomize").
Keep the same picture but fix one thing	Set the seed to fixed , change a few words, Run.
Change the shape	Edit the width/height numbers in box 4.
Use a different art model	Click the file name in box 1, pick another.
Add a LoRA (extra style/fix, like better hands)	Add a LoraLoader box between box 1 and boxes 2/3/5. Your LoRAs: Emotions, expression_helper, Hands zib.

Where this lives

The recipe file (opens on the ComfyUI canvas)	app_cabinet/comfyui/user/default/workflows/Freedom_bigLust_SDXL.json
The same recipe for the chatbot to use automatically	REPO_koboldccp_sst_tts_media/comfyui_workflows/biglust_sdsl_api.json
ComfyUI address in your browser	http://localhost:8188

How the chatbot uses this: when you ask Willow for a picture, KoboldCpp (or SillyTavern) sends your scene description into box 2 of this exact recipe, presses Run for you, and drops the finished picture into the chat. Same seven boxes — you just don't see them.
